- Uncertainty of reading (incl. zero drift) stated at reference condition of: H₂O, 18-24°C (66-76°F), 1-3 bar (15-45 psi) when installed according to field manual
- Pressure drop indications are based upon H₂O flowing in a meter with P1 pressure rating and PMO (parallel measuring tubes with manifold block) construction
- Serial path versions offer the same accuracy performance at half the flow (Nominal max. flow range of serial versions = 10 kg/min). Pressure drop will be greater
- For customized calibration range and/or uncertainty levels, please consult factory

RHM06L Pressure Ratings

The maximum pressure (P_{max}) of a sensor is determined by its lowest rated part. The lowest rated part can be either the measuring tube (P_{max}) indicated below), the construction type (P_{max}) indicated in the Part Number Code section, last page) or the process connection (for P_{max} see published standards or manufacturer information).

The sensor is manufactured with two internal measurement tubes arranged side by side. In parallel or dual path sensors, these tubes are connected in parallel and the flowing fluid is split equally between them. In serial or single path sensors, the tubes are connected end to end creating a single path through which all fluid flows.

For customization of face to face length and/or special fittings other than the ones listed on this page, please consult factory.
